8 Note: Values of  $a$  are ordinarily calculated using uncracked gross section moments of inertia for both slab and beam. Beams cross section to be considered in calculating  $I_{b1}$  and  $I_{b2}$  are shown below. (see ACI sect. 13.2.4) The relative restraint provided by the torsional resistance of the effective transverse edge

An optical lattice is formed by the interference of counter-propagating laser beams, creating a spatially periodic polarization pattern. The resulting periodic potential may trap neutral atoms via the Stark shift. [why?] Atoms are cooled and congregate in the locations of potential minima. The resulting arrangement of trapped atoms resembles a crystal lattice and can be used for quantum ...

A particle accelerator is a machine that uses electromagnetic fields to propel charged particles to very high speeds and energies, and to contain them in well-defined beams.. Large accelerators are used for basic research in particle physics. The most powerful accelerator currently is the Large Hadron Collider (LHC) near Geneva, Switzerland, built by the European collaboration CERN.

About the journal. BioResources (ISSN: 1930-2126) is a peer-reviewed online journal devoted to the science and engineering of lignocellulosic materials, chemicals, and their applications for new uses and new capabilities. An impact factor of 1.334 is listed in the 2015 Journal Citation Reports. View our current issue. Browse Volumes and Issues. Submit a Manuscript
